

Policy Development for Clean Energy Technology: Empowering Local Governing Bodies

This report delineates the proactive role undertaken by GMR Institute of Technology in collaborating with local governing bodies to develop policies focused on clean energy technology. The objective is to create a framework that fosters sustainability, encourages the adoption of eco-friendly practices, and positions the region as a leader in clean energy initiatives.

The global imperative to address climate change has prompted a shift towards sustainable practices. Local governing bodies play a pivotal role in shaping policies that influence the region's environmental footprint. The engineering college's involvement aims to provide expertise and support in developing robust policies for clean energy technology.

Our Institute works in tandem with local governing bodies to draft a framework that supports the integration of clean energy technologies. This includes setting up Solar water pumping, Solar Street lamps, support on water supplies and incentivizing clean energy investments.

In the year 2022, GMRIT helped the local governing bodies removing impurity scales in water supply bodies.
